CARBO- AND HETEROCYCLIC CARBOXYLIC ACID AND DERIVATIVES

### COMPOUNDS

This invention relates to cyclopentene compounds, to processes for their preparation, to pharmaceutical compositions containing them and to their use in medicine, in particular their use in the treatment of prostaglandin mediated diseases.

The EP<sub>1</sub> receptor is a 7-transmembrane receptor and its natural ligand is the prostaglandin PGE<sub>2</sub>. PGE<sub>2</sub> also has affinity for the other EP receptors (types EP<sub>2</sub>, EP<sub>3</sub> and EP<sub>4</sub>). The EP<sub>1</sub> receptor is associated with smooth muscle contraction, pain (in particular inflammatory, neuropathic and visceral), inflammation, allergic activities, renal regulation and gastric or enteric mucus secretion. We have now found a novel group of compounds which bind with high affinity to the EP<sub>1</sub> receptor.

A number of review articles describe the characterization and therapeutic relevance of the prostanoid receptors as well as the most commonly used selective agonists and antagonists: *Eicosanoids; From Biotechnology to Therapeutic Applications*, Folco, Samuelsson, Maclouf, and Velo eds, Plenum Press, New York, 1996, chap. 14, 137-154 and *Journal of Lipid Mediators and Cell Signalling*, 1996, 14, 83-87 and *Prostanoid Receptors, Structure, Properties and Function*, S Narumiya et al, *Physiological Reviews* 1999, 79(4), 1193-126. An article from *The British Journal of Pharmacology*, 1994, 119, 735-740 suggests that Prostaglandin E<sub>2</sub> (PGE<sub>2</sub>) exerts allodynia through EP<sub>1</sub> subtype and hyperalgesia through EP<sub>2</sub> and EP<sub>3</sub> receptors in the mouse spinal cord. Furthermore an article from *The Journal of Clinical Investigation*, 2001, 107 (3), 325 shows that in the EP<sub>1</sub> knock-out mouse pain-sensitivity responses are reduced by approximately 50%. Two papers from *Anesthesia and Analgesia* have shown that (2001, 93, 1012-7) an EP<sub>1</sub> receptor antagonist (ONO-8711) reduces hyperalgesia and allodynia in a rat model of chronic constriction injury, and that (2001, 92, 233-238) the same antagonist inhibits mechanical hyperalgesia in a rodent model of post-operative pain. S. Sarkar et al in *Gastroenterology*, 2003, 124(1), 18-25 demonstrate the efficacy of EP<sub>1</sub> receptor antagonists in the treatment of visceral pain in a human model of hypersensitivity. Thus, selective prostaglandin ligands, agonists or antagonists, depending on which prostaglandin E receptor subtype is being considered, have anti-inflammatory, antipyretic and analgesic properties similar to a conventional non-steroidal anti-inflammatory drug, and in addition, inhibit hormone-induced uterine contractions and have anti-cancer effects. These compounds have a diminished ability to induce some of the mechanism-based side effects of NSAIDs which are indiscriminate cyclooxygenase inhibitors. In particular, the compounds have a reduced potential for gastrointestinal toxicity, a reduced potential for renal side effects, a reduced effect on bleeding times and a lessened ability to induce asthma attacks in aspirin-sensitive asthmatic subjects. Moreover, by sparing potentially beneficial prostaglandin pathways, these agents may have enhanced efficacy over NSAIDs and/or COX-2 inhibitors.

In The American Physiological Society (1994, 267, R289-R-294), studies suggest that PGE<sub>2</sub>-induced hyperthermia in the rat is mediated predominantly through the EP<sub>1</sub> receptor.

WO 96/06822 (March 7, 1996), WO 96/11902 (April 25, 1996), EP 752421-A1 (January 08, 1997) and WO 01/19814 (22 March 2001) disclose compounds as being useful in the

5 treatment of prostaglandin mediated diseases.

Accordingly the present invention provides compounds of formula (I):

(I)

wherein:

A represents an optionally substituted phenyl, or an optionally substituted 5- or 6-membered heterocyclyl ring, or an optionally substituted bicyclic heterocyclyl group;

R<sup>1</sup> represents CO<sub>2</sub>R<sup>4</sup>, CO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, CH<sub>2</sub>CO<sub>2</sub>R<sup>4</sup>, optionally substituted alkyl, optionally substituted alkenyl, optionally substituted SO<sub>2</sub>alkyl, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>CONR<sup>5</sup>R<sup>6</sup>, CONR<sup>5</sup>R<sup>6</sup>, 2H-tetrazol-5-yl-methyl or optionally substituted heterocyclyl;

R<sup>2</sup> independently represents halo, optionally substituted alkyl, CN, SO<sub>2</sub>R<sup>5</sup>, SR<sup>5</sup>, NO<sub>2</sub>, optionally substituted aryl, CONR<sup>5</sup>R<sup>6</sup> or optionally substituted heteroaryl;

R<sup>x</sup> represents optionally substituted alkyl wherein 1 or 2 of the non-terminal carbon atoms may optionally be replaced by a group independently selected from NR<sup>4</sup>, O or SO<sub>n</sub>, wherein n is 0, 1 or 2; or R<sup>x</sup> may be optionally substituted CQ<sub>2</sub>-heterocyclyl or optionally substituted CQ<sub>2</sub>-phenyl wherein Q is independently selected from hydrogen and CH<sub>3</sub>;

R<sup>4</sup> represents hydrogen or an optionally substituted alkyl;

R<sup>5</sup> represents hydrogen or an optionally substituted alkyl;

R<sup>6</sup> represents hydrogen or an optionally substituted alkyl, optionally substituted SO<sub>2</sub>aryl, optionally substituted SO<sub>2</sub>heterocyclyl group, CN, optionally substituted CH<sub>2</sub>aryl or COR<sup>7</sup>;

R<sup>7</sup> represents hydrogen, optionally substituted heteroaryl or optionally substituted aryl;

R<sup>8</sup> and R<sup>9</sup> independently represent hydrogen or alkyl; and

n is an integer from 0 to 2;

wherein when A is a 6-membered ring the R<sup>1</sup> and cyclopentene group are attached to carbon atoms 1,2-, 1,3- or 1,4- relative to each other, and when A is a five-membered ring or bicyclic heterocyclyl group the R<sup>1</sup> and cyclopentene group are attached to substitutable carbon atoms 1,2- or 1,3- relative to each other; or pharmaceutically acceptable derivatives thereof.

When A is a six membered ring, preferably R<sup>1</sup> is attached to the group A in the 3 position relative to the bond attaching A to the cyclopentene ring.

Preferably R<sup>1</sup> represents CO<sub>2</sub>R<sup>4</sup>, wherein R<sup>4</sup> is hydrogen or C<sub>1-4</sub>alkyl.

- 5 Preferably A is selected from phenyl, pyridyl, pyridazinyl, pyrazinyl or pyrimidinyl, all of which may be optionally substituted. In an other aspect, A is selected from an optionally substituted phenyl, pyridyl, pyridazinyl, pyrazinyl or pyrimidinyl; more preferably A is pyridyl or an optionally substituted phenyl; most preferably A is optionally substituted phenyl. In an alternative aspect A is pyridyl.

10

In an alternative aspect:

A represents an optionally substituted phenyl, or an optionally substituted 5- or 6-membered heterocyclyl group;

- 15 R<sup>1</sup> represents CO<sub>2</sub>R<sup>4</sup>, CONR<sup>5</sup>R<sup>6</sup>, CH<sub>2</sub>CO<sub>2</sub>R<sup>4</sup>, optionally substituted C<sub>1-6</sub>alkyl, optionally substituted C<sub>1-6</sub>alkenyl, SO<sub>2</sub>C<sub>1-6</sub>alkyl, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>CONR<sup>5</sup>R<sup>6</sup>, tetrazolyl or CONR<sup>5</sup>R<sup>6</sup>;

R<sup>2</sup> independently represents halo, optionally substituted C<sub>1-6</sub>alkyl, CN, SO<sub>2</sub>R<sup>5</sup>, SR<sup>5</sup>, NO<sub>2</sub>, optionally substituted aryl, CONR<sup>5</sup>R<sup>6</sup> or optionally substituted heteroaryl;

R<sup>x</sup> represents optionally substituted C<sub>1-6</sub>alkyl or optionally substituted -CH<sub>2</sub>-phenyl;

R<sup>4</sup> represents hydrogen or an optionally substituted C<sub>1-6</sub>alkyl;

- 20 R<sup>5</sup> represents hydrogen or an optionally substituted C<sub>1-6</sub>alkyl;

R<sup>6</sup> represents hydrogen or an optionally substituted C<sub>1-6</sub>alkyl, optionally substituted SO<sub>2</sub>aryl, optionally substituted SO<sub>2</sub>heterocyclyl group, CN, optionally substituted CH<sub>2</sub>aryl or COR<sup>7</sup>;

R<sup>7</sup> represents hydrogen or an optionally substituted aryl;

- 25 R<sup>8</sup> and R<sup>9</sup> independently represent hydrogen or C<sub>1-6</sub>alkyl;

n is an integer from 0 to 2;

wherein R<sup>1</sup> is attached to the group A in the 3 or 4 position relative to the bond attaching A to the cyclopentene ring;

or pharmaceutically acceptable derivatives thereof.

30

In a further aspect, A is optionally substituted phenyl or a 5- or 6-membered heterocyclyl group.

Optional substituents for A when a phenyl group include up to four substituents, preferably 0 or 1 substituent, independently selected from halogen, NR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>COC<sub>1-6</sub>alkyl,

- 35 NR<sup>5</sup>SO<sub>2</sub>C<sub>1-6</sub>alkyl, OR<sup>5</sup>, C<sub>1-6</sub>alkyl and NR<sup>10</sup>R<sup>11</sup> wherein R<sup>10</sup> and R<sup>11</sup> together with the nitrogen atom to which they are attached form a morpholine ring, a 5- or 6-membered lactam ring or a 5- or 6-membered cyclic sulphonamide, wherein R<sup>5</sup> and R<sup>6</sup> are as defined above. Preferably optional substituents for A are selected from halogen, NR<sup>5</sup>R<sup>6</sup>, NHCOC<sub>1-6</sub>alkyl, NHSO<sub>2</sub>C<sub>1-6</sub>alkyl, C<sub>1-6</sub>alkyl and NR<sup>10</sup>R<sup>11</sup>.

40

In an alternative aspect optional substituents for A when a phenyl group include up to four substituents independently selected from  $C_{1-6}$ alkyl,  $C_{1-6}$ alkoxy and halogen. Preferably A when a phenyl group is optionally substituted by up to 2 substituents.

- 5 Optional substituents for A when a 5- or 6-membered heterocyclyl group include  $NH_2$ . When A is pyridyl it may be substituted on the ring nitrogen by an oxygen to give a pyridine N-oxide. In an alternative aspect  $R^1$  represents  $CO_2R^4$ ,  $CONR^5R^6$ ,  $CH_2CO_2R^4$ , optionally substituted  $C_{1-6}$ alkyl, optionally substituted  $C_{1-6}$ alkenyl,  $SO_2C_{1-6}$ alkyl,  $SO_2NR^5R^6$ ,  $NR^5CONR^5R^6$ , tetrazolyl or  $COSO_2NR^5R^6$ .

10

In another aspect  $R^2$  independently represents halo, optionally substituted  $C_{1-6}$ alkyl, CN,  $SO_2R^5$ ,  $NO_2$ , optionally substituted aryl,  $CONR^5R^6$  or optionally substituted heteroaryl. In an alternative aspect  $R^6$  represents hydrogen or an optionally substituted  $C_{1-6}$ alkyl, optionally substituted  $SO_2$ aryl, optionally substituted  $SO_2$ heterocyclyl group, CN, or  $COR^7$ .

15

Preferably  $R^1$  represents  $CO_2R^4$ . More preferably  $R^1$  represents  $CO_2H$ .

Preferably  $R^2$  represents halo, optionally substituted  $C_{1-6}$ alkyl e.g.  $C_{1-4}$ alkyl and  $CF_3$ , CN,  $SC_{1-6}$ alkyl, e.g.  $SCH_3$  or  $SO_2C_{1-6}$ alkyl, e.g.  $SO_2CH_3$ . Alternatively  $R^2$  represents halogen, optionally substituted  $C_{1-6}$ alkyl, for example  $CF_3$ , CN or  $SO_2C_{1-6}$ alkyl.

Preferably  $R^4$  represents hydrogen or  $C_{1-3}$ alkyl.

20

Preferably  $R^5$  represents hydrogen or  $C_{1-3}$ alkyl.

Preferably  $R^6$  represents hydrogen or  $C_{1-3}$ alkyl.

Preferably  $R^8$  represents methyl or hydrogen, more preferably  $R^8$  represents hydrogen.

Preferably  $R^9$  represents hydrogen.

Preferably n is 0 or 1.

25

When  $R^x$  represents an optionally substituted alkyl this group is preferably  $C_{1-8}$ alkyl, more preferably the alkyl group is  $CH_2C_{5-6}$ cycloalkyl.

$R^x$  preferably represents  $CH_2$ phenyl optionally substituted by one, two or three, preferably one or two substituents selected from Cl, Br, F,  $CF_3$ ,  $C_{1-4}$ alkyl and  $OC_{1-4}$ alkyl or  $R^x$  is  $CH_2C_{5-6}$ cycloalkyl.

30

Preferred compounds of formula (I) are compounds of formula (II):

(II)

wherein:

R<sup>1</sup> is CO<sub>2</sub>R<sup>4</sup>;

R<sup>2</sup> is halo, optionally substituted C<sub>1-6</sub>alkyl e.g. C<sub>1-4</sub>alkyl and CF<sub>3</sub>, CN, SC<sub>1-6</sub>alkyl, or SO<sub>2</sub>C<sub>1-6</sub>alkyl;

5 R<sup>3</sup> independently represents halo, optionally substituted OC<sub>1-6</sub>alkyl, or optionally substituted C<sub>1-6</sub>alkyl;

m is an integer from 0 to 3;

n is an integer from 0 to 2;

10 W, X, Y and Z each represents CR<sup>12</sup> or N wherein at least two of W, X, Y or Z is CR<sup>12</sup>; and when each of W, X, Y, and Z is CR<sup>12</sup> then each R<sup>12</sup> is independently selected from hydrogen, halogen, NR<sup>5</sup>R<sup>6</sup>, NHCOC<sub>1-6</sub>alkyl, NHSO<sub>2</sub>C<sub>1-6</sub>alkyl, C<sub>1-6</sub>alkyl and NR<sup>10</sup>R<sup>11</sup>, and when at least one of W, X, Y and Z represents N then each R<sup>12</sup> is selected from hydrogen or NH<sub>2</sub>;

or pharmaceutically acceptable derivatives thereof.

15

In an alternative aspect of compounds of formula II:

R<sup>1</sup> is CO<sub>2</sub>R<sup>4</sup>;

R<sup>2</sup> is halogen, optionally substituted C<sub>1-6</sub>alkyl e.g. CF<sub>3</sub>, CN, SC<sub>1-6</sub>alkyl or SO<sub>2</sub>C<sub>1-6</sub>alkyl;

R<sup>3</sup> independently represents halo or an optionally substituted OC<sub>1-6</sub>alkyl, or C<sub>1-6</sub>alkyl;

20 m is an integer from 0 to 2;

n is an integer from 0 to 2;

W, X, Y and Z represents CH or N wherein at least one of W, X, Y or Z is CH; or pharmaceutically acceptable derivatives thereof.

25

In another aspect R<sup>2</sup> is halogen, optionally substituted C<sub>1-6</sub>alkyl e.g. CF<sub>3</sub>, CN, or SO<sub>2</sub>C<sub>1-6</sub>alkyl.

In a further aspect R<sup>3</sup> represents halo, optionally substituted C<sub>1-4</sub>alkyl e.g. CF<sub>3</sub>, or optionally substituted OC<sub>1-4</sub>alkyl, more preferably R<sup>3</sup> is halo or OMe.

and pharmaceutically acceptable derivatives thereof.

- 10 Preferred compounds include the compounds of Examples 19, 29, 32, 52, 90, 140 and 153.

Preferably compounds are selective for EP<sub>1</sub> over EP<sub>3</sub>. More preferably the compounds are 100 fold selective, more preferably 1000 fold selective for EP<sub>1</sub> over EP<sub>3</sub>.

- 15 The invention is described using the following definitions unless otherwise indicated.

- 20 The term "pharmaceutically acceptable derivative" means any pharmaceutically acceptable salt, ester, salt of such ester or solvate of the compounds of formula (I), or any other compound which upon administration to the recipient is capable of providing (directly or indirectly) a compound of formula (I) or an active metabolite or residue thereof.

- 25 It will be appreciated by those skilled in the art that the compounds of formula (I) may be modified to provide pharmaceutically acceptable derivatives thereof at any of the functional groups in the compounds, and that the compounds of formula (I) may be derivatised at more than one position.

- It will be appreciated that, for pharmaceutical use, the salts referred to above will be physiologically acceptable salts, but other salts may find use, for example in the preparation of compounds of formula (I) and the physiological acceptable salts thereof.
- 30 Pharmaceutically acceptable salts include those described by Berge, Bighley and Monkhouse, J. Pharm. Sci., 1977, 66, 1-19. The term "pharmaceutically acceptable salts" refers to salts prepared from pharmaceutically acceptable non-toxic bases including inorganic bases and organic bases. Salts derived from inorganic bases include aluminum, ammonium, calcium, copper, ferric, ferrous, lithium, magnesium, manganic salts, manganous, potassium, sodium, zinc, and the like. Particularly preferred are the ammonium, calcium, magnesium, potassium, and sodium salts. Salts derived from pharmaceutically acceptable organic non-toxic bases include salts of primary, secondary, and tertiary amines, substituted amines including naturally occurring substituted amines, cyclic amines, and basic ion exchange resins, such as arginine, betaine, caffeine, choline, N,N'-dibenzylethylenediamine, diethylamine, 2-diethylaminoethanol, 2-dimethylaminoethanol, ethanolamine, ethylenediamine, N-ethyl-morpholine, N-ethylpiperidine, glucamine, glucosamine, histidine, hydrabamine, isopropylamine, lysine, methylglucamine, morpholine, piperazine, piperidine, polyamine

resins, procaine, purines, theobromine, triethylamine, trimethylamine, tripropyl amine, tromethamine, and the like. When the compound of the present invention is basic, salts may be prepared from pharmaceutically acceptable non-toxic acids, including inorganic and organic acids. Such acids include acetic, benzenesulfonic, benzoic, camphorsulfonic, citric, ethanesulfonic, fumaric, gluconic, glutamic, hydrobromic, hydrochloric, isethionic, lactic, maleic, malic, mandelic, methanesulfonic, mucic, nitric, pamoic, pantothenic, phosphoric, succinic, sulfuric, tartaric, p-toluenesulfonic acid, and the like. Particularly preferred are citric, hydrobromic, hydrochloric, maleic, phosphoric, sulfuric, and tartaric acid.

Preferred examples of pharmaceutically acceptable salts include those formed from maleic, fumaric, benzoic, ascorbic, pamoic, succinic, bismethylenesalicylic, methanesulfonic, ethanedisulfonic, propionic, tartaric, salicylic, citric, gluconic, aspartic, stearic, palmitic, itaconic, glycolic, p-aminobenzoic, glutamic, benzenesulfonic, cyclohexylsulfamic, phosphoric and nitric acids.

The salts and/or solvates of the compounds of the formula (I) which are not pharmaceutically acceptable may be useful as intermediates in the preparation of pharmaceutically acceptable salts and/or solvates of compounds of formula (I) or the compounds of the formula (I) themselves, and as such form another aspect of the present invention.

The compounds of formula (I) may be prepared in crystalline or non-crystalline form, and if crystalline, may be optionally hydrated or solvated. This invention includes in its scope stoichiometric hydrates as well as compounds containing variable amounts of water.

Suitable solvates include pharmaceutically acceptable solvates, such as hydrates.

Solvates include stoichiometric solvates and non-stoichiometric solvates.

The terms "halogen" or "halo" are used to represent fluorine, chlorine, bromine or iodine.

The term "alkyl" as a group or part of a group means a straight, branched or cyclic chain alkyl group or combinations thereof, for example a methyl, ethyl, n-propyl, i-propyl, n-butyl, s-butyl, t-butyl, pentyl, hexyl, 1,1-dimethylethyl, cyclopentyl or cyclohexyl or combinations thereof such as cyclohexylmethyl and cyclopentylmethyl. Unless otherwise defined, preferably "alkyl" is C<sub>1-8</sub>alkyl, more preferably "alkyl" is C<sub>1-6</sub>alkyl.

The term "alkoxy" as a group or as part of a group means a straight, branched or cyclic chain alkyl group having an oxygen atom attached to the chain, for example a methoxy, ethoxy, n-propoxy, i-propoxy, n-butoxy, s-butoxy, t-butoxy group, pentoxy, hexyloxy group, cyclopentoxy or cyclohexyloxy group. Preferably "alkoxy" is C<sub>1-8</sub> alkoxy.

The term "haloalkyl" means an alkyl group, including straight, branched or cyclic structures, of the indicated number of carbon atoms in which one or more hydrogen atoms have been replaced by halogen atoms, with up to complete substitution of all hydrogen atoms with halo groups. Preferably "haloalkyl" is C<sub>1-6</sub>haloalkyl. C<sub>1-6</sub>haloalkyl, for example, includes C<sub>1-</sub>

5     <sub>6</sub>fluoroalkyl, e.g. CF<sub>3</sub>, CF<sub>2</sub>CF<sub>3</sub> and the like.

The term "haloalkoxy" means an alkoxy group, including straight, branched or cyclic structures, of the indicated number of carbon atoms in which one or more hydrogen atoms have been replaced by halogen atoms, with up to complete substitution of all hydrogen atoms with halo groups. . Preferably "haloalkoxy" is C<sub>1-6</sub>haloalkoxy. C<sub>1-6</sub>haloalkoxy, for example, includes C<sub>1-6</sub>fluoroalkoxy e.g. OCF<sub>3</sub>, OCF<sub>2</sub>CF<sub>3</sub> and the like.

10

The term "alkenyl" means linear or branched structures and combinations thereof, of the indicated number of carbon atoms, having at least one carbon-to-carbon double bond, wherein hydrogen may be replaced by an additional carbon to carbon double bond. Preferably "alkenyl" is C<sub>2-6</sub>alkenyl. C<sub>2-6</sub>alkenyl, for example, includes ethenyl, propenyl, 1-methylethenyl, butenyl and the like.

15

The term "heterocyclyl" as a group or as part of a group means an aromatic or non-aromatic five or six membered ring which contains from 1 to 4 heteroatoms selected from nitrogen, oxygen or sulfur and unsubstituted or substituted by, for example, up to three substituents. Examples of 5-membered heterocyclyl groups include pyrrolanyl, pyrrolyl, oxazolyl, thiazolyl, imidazolyl, oxadiazolyl, thiadiazolyl, triazolyl, triazinyl, isothiazolyl, isoxazolyl, thiophenyl, pyrazolyl or tetrazolyl. Examples of 6-membered heterocyclyl groups are pyridyl, pyridazinyl, pyrimidinyl, pyrazinyl, triazinyl or tetrazinyl.

20

25

The term "aryl" as a group or part of a group means a 5- or 6- membered aromatic ring, for example phenyl, or a 7 to 12 membered bicyclic ring system where at least one of the rings is aromatic, for example naphthyl. An aryl group may be optionally substituted by one or more substituents, for example up to 4, 3 or 2 substituents. Preferably the aromatic group is phenyl.

30

The term "heteroaryl" as a group or as part of a group means a monocyclic five or six membered aromatic ring, or a fused bicyclic aromatic ring system comprising two of such monocyclic five or six membered aromatic rings. These heteroaryl rings contain one or more heteroatoms selected from nitrogen, oxygen or sulfur, where N-oxides, sulfur oxides and sulfur dioxides are permissible heteroatom substitutions. A heteroaryl group may be optionally substituted by one or more substituents, for example up to 3 or up to 2 substituents. Examples of "heteroaryl" used herein include furyl, thienyl, pyrrolyl, imidazolyl, pyrazolyl, triazolyl, tetrazolyl, thiazolyl, oxazolyl, isoxazolyl, oxadiazolyl, thiadiazolyl, isothiazolyl, pyridinyl, pyrimidinyl, quinolinyl, isoquinolinyl, benzofuryl, benzothienyl, indolyl, and indazolyl.

35

40

The term "bicyclic heterocyclyl" when used herein means a fused bicyclic aromatic or non-aromatic bicyclic heterocyclyl ring system comprising up to four, preferably one or two, heteroatoms each selected from oxygen, nitrogen and sulphur. Each ring may have from 4 to 7, preferably 5 or 6, ring atoms. A bicyclic heteroaromatic ring system may include a carbocyclic ring. Examples of bicyclic heterocyclyl groups include quinolinyl, isoquinolinyl, quinoxalinyl, quinazolinyl, pyridopyrazinyl, benzoxazolyl, benzothiophenyl, benzimidazolyl, benzothiazolyl, benzoxadiazolyl, benzthiadiazolyl, indolyl, benztriazolyl or naphthyridinyl.

When the heteroatom nitrogen replaces a carbon atom in an alkyl group, or when nitrogen is present in a heteroaryl, heterocyclyl or bicyclic heterocyclyl group, the nitrogen atom will, where appropriate be substituted by one or two substituents selected from hydrogen and C<sub>1-8</sub>alkyl, preferably hydrogen and C<sub>1-8</sub>alkyl, more preferably hydrogen.

Optional substituents for alkyl or alkenyl groups are OH, CO<sub>2</sub>R<sup>4</sup>, NR<sup>4</sup>R<sup>5</sup>, (O), OC<sub>1-6</sub>alkyl or halo, wherein R<sup>4</sup> and R<sup>5</sup> are as herein before defined. An alkyl or alkenyl group may be substituted by one or more optional substituents, for example up to 5, 4, 3, or 2 optional substituents.

Unless otherwise defined, optional substituents for aryl, heteroaryl or heterocyclyl moieties as a group or part of a group are selected from optionally substituted C<sub>1-6</sub>alkyl, optionally substituted C<sub>1-6</sub>alkoxy and halogen. Alternative optional substituents include C<sub>1-6</sub>alkyl, C<sub>1-6</sub>alkoxy and halogen.

Compounds of formula (I) can be prepared as set forth in the following schemes and in the examples. The following processes form another aspect of the present invention.

For example, compounds of formula (I) may be prepared by the general route below:

wherein  $L^1$ ,  $L^2$ , are leaving groups for example halo, or triflate;  $L^3$  and  $L^4$  is an activating group, for example selected from stannanes including trialkylstannane, and boranes including boronic acid and boronate; P is a protecting group, for example methyl, ethyl or substituted benzyl esters; and A,  $R^8$ ,  $R^9$  and  $R^x$  are as defined for compounds of formula (I).  $L^1$  can be converted to  $L^{1'}$ , wherein  $L^{1'}$  is an activating group for example a stannane or a boronic acid or boronic ester, and in this situation  $L^4$  can be halo or triflate.

Alternatively compounds of formula (I) may be prepared according to the route described below:

wherein  $L^1$ ,  $L^2$ ,  $L^3$ ,  $L^4$  and P are as defined above and A,  $R^8$ ,  $R^9$  and  $R^x$  are as defined for compounds of formula (I).  $L^1$  can be converted to  $L^{1'}$ , wherein  $L^{1'}$  is an activating group, for example, a stannane or a boronic acid or boronic ester, and in this situation  $L^4$  can be halo or triflate.

The preparation and reactions of boronic acids and esters is reviewed in Suzuki *et al*, *Synth. Commun.*, 1981, 11, 513; Martin *et al*, *Acta. Chim. Scand.*, 1993, 47, 221; and Miyaoura *et al*, *Chem. Rev.*, 1995, 95, 2457.

- 5 Certain substituents in reaction intermediates and compounds of formula (I) may be converted to other substituents by conventional methods known to those skilled in the art.

For example, when  $R^x$  is methyl, cleavage of the ether to give the phenol is carried out using, for example, sodium methanethiolate. Conversion to another  $R^x$  group, for example  
 10 a substituted benzyl group, may be effected by reaction of the phenol with a suitable substituted benzyl bromide. The skilled person will appreciate that conversion of the protecting group P to another protecting group P may also occur under the reaction conditions used. When  $R^x$  is benzyl, cleavage of the ether to give the phenol may be  
 15 carried out using, for example, HBr in acetic acid. The resulting phenol can then be converted to another group  $R^x$  as described above.

It will be appreciated by those skilled in the art that it may be necessary to protect certain reactive substituents during some of the above procedures. Standard protection and deprotection techniques, such as those described in Greene T.W. 'Protective groups in  
 20 organic synthesis', New York, Wiley (1981), can be used. For example, carboxylic acid groups can be protected as esters. Deprotection of such groups is achieved using conventional procedures known in the art. It will be appreciated that ~~protection and deprotection~~  
 may be interconverted by conventional means.

- 25 Cyclopentene intermediates of the formula:

- 30 wherein  $L^1$ ,  $L^2$  are as defined above and  $R^8$  and  $R^9$  are as hereinbefore defined for compounds of formula (I) are commercially available or may be readily prepared according to known methods.

Compounds of the formula:

- 35 wherein  $L^4$  is as hereinbefore defined, and  $R^x$  and  $R^2$  are as defined for compounds of formula (I) are commercially available, or may readily be prepared by methods known to

those skilled in the art, for example from suitable commercially available anisoles or phenols using methods as described in the examples.

Compounds of the formula:

wherein  $L^3$  and  $P$  are as defined above and  $R^1$  and  $A$  are as hereinbefore defined for compounds of formula (I) are commercially available or may readily be prepared, for example, from suitable halobenzoic acid esters according to known methods, for example using methods as described in the examples.

It is to be understood that the present invention encompasses all isomers of formula (I) and their pharmaceutically acceptable derivatives, including all geometric, tautomeric and optical forms, and mixtures thereof (e.g. racemic mixtures). Where additional chiral centres are present in compounds of formula (I), the present invention includes within its scope all possible diastereoisomers, including mixtures thereof. The different isomeric forms may be separated or resolved one from the other by conventional methods, or any given isomer may be obtained by conventional synthetic methods or by stereospecific or asymmetric syntheses.

The compounds of the invention bind to the  $EP_1$  receptor and are therefore useful in treating  $EP_1$  receptor mediated diseases.

In view of their ability to bind to the  $EP_1$  receptor, the compounds of the invention may be useful in the treatment of the disorders that follow. Thus, the compounds of formula (I) may be useful as analgesics. For example they may be useful in the treatment of chronic articular pain (e.g. rheumatoid arthritis, osteoarthritis, rheumatoid spondylitis, gouty arthritis and juvenile arthritis) including the property of disease modification and joint structure preservation; musculoskeletal pain; lower back and neck pain; sprains and strains; neuropathic pain; sympathetically maintained pain; myositis; pain associated with cancer and fibromyalgia; pain associated with migraine; pain associated with influenza or other viral infections, such as the common cold; rheumatic fever; pain associated with functional bowel disorders such as non-ulcer dyspepsia, non-cardiac chest pain and irritable bowel syndrome; pain associated with myocardial ischemia; post operative pain; headache; toothache; and dysmenorrhea. The compounds of the invention may also be useful in the treatment of visceral pain.

The compounds of the invention may be particularly useful in the treatment of neuropathic pain. Neuropathic pain syndromes can develop following neuronal injury and the resulting pain may persist for months or years, even after the original injury has healed. Neuronal injury may occur in the peripheral nerves, dorsal roots, spinal cord or certain regions in the

brain. Neuropathic pain syndromes are traditionally classified according to the disease or event that precipitated them. Neuropathic pain syndromes include: diabetic neuropathy; sciatica; non-specific lower back pain; multiple sclerosis pain; fibromyalgia; HIV-related neuropathy; post-herpetic neuralgia; trigeminal neuralgia; and pain resulting from physical trauma, amputation, cancer, toxins or chronic inflammatory conditions. These conditions are difficult to treat and although several drugs are known to have limited efficacy, complete pain control is rarely achieved. The symptoms of neuropathic pain are incredibly heterogeneous and are often described as spontaneous shooting and lancinating pain, or ongoing, burning pain. In addition, there is pain associated with normally non-painful sensations such as "pins and needles" (paraesthesias and dysesthesias), increased sensitivity to touch (hyperesthesia), painful sensation following innocuous stimulation (dynamic, static or thermal allodynia), increased sensitivity to noxious stimuli (thermal, cold, mechanical hyperalgesia), continuing pain sensation after removal of the stimulation (hyperpathia) or an absence of or deficit in selective sensory pathways (hypoalgesia).

The compounds of formula (I) may also be useful in the treatment of fever.

The compounds of formula (I) may also be useful in the treatment of inflammation, for example in the treatment of skin conditions (e.g. sunburn, burns, eczema, dermatitis, psoriasis); ophthalmic diseases such as glaucoma, retinitis, retinopathies, uveitis and of acute injury to the eye tissue (e.g. conjunctivitis); lung disorders (e.g. asthma, bronchitis, emphysema, chronic obstructive pulmonary disease, (COPD); gastrointestinal tract disorders (e.g. aphthous ulcer, Crohn's disease, atopic gastritis, gastritis varioliforme, ulcerative colitis, coeliac disease, regional ileitis, irritable bowel syndrome, inflammatory bowel disease, gastrointestinal reflux disease); organ transplantation; other conditions with an inflammatory component such as vascular disease, migraine, periarteritis nodosa, thyroiditis, aplastic anaemia, Hodgkin's disease, sclerodoma, myaesthesia gravis, multiple sclerosis, sarcoidosis, nephrotic syndrome, Bechet's syndrome, polymyositis, gingivitis, myocardial ischemia, pyrexia, systemic lupus erythematosus, tendinitis, bursitis, and Sjogren's syndrome.

The compounds of formula (I) are also useful in the treatment of immunological diseases such as autoimmune diseases, immunological deficiency diseases or organ transplantation. The compounds of formula (I) are also effective in increasing the latency of HIV infection.

The compounds of formula (I) are also useful in the treatment of diseases of abnormal platelet function (e.g. occlusive vascular diseases).

The compounds of formula (I) are also useful for the preparation of a drug with diuretic action.

The compounds of formula (I) are also useful in the treatment of impotence or erectile dysfunction.

5 The compounds of formula (I) are also useful in the treatment of bone disease characterised by abnormal bone metabolism or resorption such as osteoporosis (especially postmenopausal osteoporosis), hyper-calcemia, hyperparathyroidism, Paget's bone diseases, osteolysis, hypercalcemia of malignancy with or without bone metastases, rheumatoid arthritis, periodontitis, osteoarthritis, ostealgia, osteopenia, cancer cachexia, calculosis, lithiasis (especially urolithiasis), solid carcinoma, gout and ankylosing  
10 spondylitis, tendinitis and bursitis.

The compounds of formula (I) are also useful for attenuating the hemodynamic side effects of non-steroidal anti-inflammatory drugs (NSAID's) and cyclooxygenase-2 (COX-2) inhibitors.

15 The compounds of formula (I) are also useful in the treatment of cardiovascular diseases such as hypertension or myocardial ischemia; functional or organic venous insufficiency; varicose therapy; haemorrhoids; and shock states associated with a marked drop in arterial pressure (e.g. septic shock).

20 The compounds of formula (I) are also useful in the treatment of neurodegenerative diseases and neurodegeneration such as dementia, particularly degenerative dementia (including senile dementia, Alzheimer's disease, Pick's disease, Huntingdon's chorea, Parkinson's disease and Creutzfeldt-Jakob disease, ALS, motor neuron disease); vascular  
25 dementia (including multi-infarct dementia); as well as dementia associated with intracranial space occupying lesions; trauma; infections and related conditions (including HIV infection); metabolism; toxins; anoxia and vitamin deficiency; and mild cognitive impairment associated with ageing, particularly Age Associated Memory Impairment. The compounds of formula (I) are also useful in the treatment of neuroprotection and in  
30 the treatment of neurodegeneration following stroke, cardiac arrest, pulmonary bypass, traumatic brain injury, spinal cord injury or the like.

The compounds of formula (I) are also useful in the treatment of tinnitus.

35 The compounds of formula (I) are also useful in preventing or reducing dependence on, or preventing or reducing tolerance or reverse tolerance to, a dependence - inducing agent. Examples of dependence inducing agents include opioids (e.g. morphine), CNS depressants (e.g. ethanol), psychostimulants (e.g. cocaine) and nicotine. The compounds of formula (I) are also useful in the treatment of complications of Type 1  
40 diabetes (e.g. diabetic microangiopathy, diabetic retinopathy, diabetic nephropathy, macular degeneration, glaucoma), nephrotic syndrome, aplastic anaemia, uveitis, Kawasaki disease and sarcoidosis.

The compounds of formula (I) are also useful in the treatment of kidney dysfunction (nephritis, particularly mesangial proliferative glomerulonephritis, nephritic syndrome), liver dysfunction (hepatitis, cirrhosis), gastrointestinal dysfunction (diarrhoea) and colon cancer.

5

It is to be understood that reference to treatment includes both treatment of established symptoms and prophylactic treatment, unless explicitly stated otherwise.

10

According to a further aspect of the invention, we provide a compound of formula (I) or a pharmaceutically acceptable derivative thereof for use in human or veterinary medicine.

15

According to another aspect of the invention, we provide a compound of formula (I) or a pharmaceutically acceptable derivative thereof for use in the treatment of a condition which is mediated by the action of  $\text{PGE}_2$  at  $\text{EP}_1$  receptors.

20

According to a further aspect of the invention, we provide a method of treating a human or animal subject suffering from a condition which is mediated by the action of  $\text{PGE}_2$  at  $\text{EP}_1$  receptors which comprises administering to said subject an effective amount of a compound of formula (I) or a pharmaceutically acceptable derivative thereof.

25

According to a further aspect of the invention we provide a method of treating a human or animal subject suffering from a pain, inflammatory, immunological, bone, neurodegenerative or renal disorder, which method comprises administering to said subject an effective amount of a compound of formula (I) or a pharmaceutically acceptable derivative thereof.

30

According to a yet further aspect of the invention we provide a method of treating a human or animal subject suffering from inflammatory pain, neuropathic pain or visceral pain which method comprises administering to said subject an effective amount of a compound of formula (I) or a pharmaceutically acceptable derivative thereof.

35

According to another aspect of the invention, we provide the use of a compound of formula (I) or a pharmaceutically acceptable derivative thereof for the manufacture of a medicament for the treatment of a condition which is mediated by the action of  $\text{PGE}_2$  at  $\text{EP}_1$  receptors.

40

According to another aspect of the invention we provide the use of a compound of formula (I) or a pharmaceutically acceptable derivative thereof for the manufacture of a medicament for the treatment or prevention of a condition such as a pain, inflammatory, immunological, bone, neurodegenerative or renal disorder.

According to another aspect of the invention we provide the use of a compound of formula (I) or a pharmaceutically acceptable derivative thereof for the manufacture of a medicament for the treatment or prevention of a condition such as inflammatory pain, neuropathic pain or visceral pain.

5

The compounds of formula (I) and their pharmaceutically acceptable derivatives are conveniently administered in the form of pharmaceutical compositions. Such compositions may conveniently be presented for use in conventional manner in admixture with one or more physiologically acceptable carriers or excipients.

10

Thus, in another aspect of the invention, we provide a pharmaceutical composition comprising a compound of formula (I) or a pharmaceutically acceptable derivative thereof adapted for use in human or veterinary medicine.

15

The compounds of formula (I) and their pharmaceutically acceptable derivatives may be formulated for administration in any suitable manner. They may, for example, be formulated for topical administration or administration by inhalation or, more preferably, for oral, transdermal or parenteral administration. The pharmaceutical composition may be in a form such that it can effect controlled release of the compounds of formula (I) and their pharmaceutically acceptable derivatives.

20

For oral administration, the pharmaceutical composition may take the form of, for example, tablets (including sub-lingual tablets), capsules, powders, solutions, syrups or suspensions prepared by conventional means with acceptable excipients.

25

For transdermal administration, the pharmaceutical composition may be given in the form of a transdermal patch, such as a transdermal iontophoretic patch.

30

For parenteral administration, the pharmaceutical composition may be given as an injection or a continuous infusion (e.g. intravenously, intravascularly or subcutaneously). The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles and may contain formulatory agents such as suspending, stabilising and/or dispersing agents. For administration by injection these may take the form of a unit dose presentation or as a multidose presentation preferably with an added preservative.

35

Alternatively for parenteral administration the active ingredient may be in powder form for reconstitution with a suitable vehicle.

40

The compounds of the invention may also be formulated as a depot preparation. Such long acting formulations may be administered by implantation (for example subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, the compounds of the invention may be formulated with suitable polymeric or hydrophobic materials (for example as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives, for example, as a sparingly soluble salt.

The EP<sub>1</sub> receptor compounds for use in the instant invention may be used in combination with other therapeutic agents, for example COX-2 inhibitors, such as celecoxib, deracoxib, rofecoxib, valdecoxib, parecoxib or COX-189; 5-lipoxygenase inhibitors; NSAID's, such as diclofenac, indomethacin, nabumetone or ibuprofen; leukotriene receptor antagonists; DMARD's such as methotrexate; adenosine A1 receptor agonists; sodium channel blockers, such as lamotrigine; NMDA receptor modulators, such as glycine receptor antagonists; gabapentin and related compounds; tricyclic antidepressants such as amitriptyline; neurone stabilising antiepileptic drugs; mono-aminergic uptake inhibitors such as venlafaxine; opioid analgesics; local anaesthetics; 5HT<sub>1</sub> agonists, such as triptans, for example sumatriptan, naratriptan, zolmitriptan, eletriptan, frovatriptan, almotriptan or rizatriptan; nicotinic acetyl choline (nACh) receptor modulators; glutamate receptor modulators, for example modulators of the NR2B subtype; EP<sub>4</sub> receptor ligands; EP<sub>2</sub> receptor ligands; EP<sub>3</sub> receptor ligands; EP<sub>4</sub> antagonists; EP<sub>2</sub> antagonists and EP<sub>3</sub> antagonists; cannabinoid receptor ligands; bradykinin receptor ligands and vanilloid receptor ligand. When the compounds are used in combination with other therapeutic agents, the compounds may be administered either sequentially or simultaneously by any convenient route.

Additional COX-2 inhibitors are disclosed in US Patent Nos. 5,474,995 US5,633,272; US5,466,823, US6,310,099 and US6,291,523; and in WO 96/25405, WO 97/38986, WO 98/03484, WO 97/14362, WO 99/12930, WO00/26216, WO00/52008, WO00/38311, WO01/58881 and WO02/18374.

The invention thus provides, in a further aspect, a combination comprising a compound of formula (I) or a pharmaceutically acceptable derivative thereof together with a further therapeutic agent or agents.

The combinations referred to above may conveniently be presented for use in the form of a pharmaceutical formulation and thus pharmaceutical formulations comprising a combination as defined above together with a pharmaceutically acceptable carrier or excipient comprise a further aspect of the invention. The individual components of such combinations may be administered either sequentially or simultaneously in separate or combined pharmaceutical formulations.

When a compound of formula (I) or a pharmaceutically acceptable derivative thereof is used in combination with a second therapeutic agent active against the same disease state the dose of each compound may differ from that when the compound is used alone. Appropriate doses will be readily appreciated by those skilled in the art.

A proposed daily dosage of compounds of formula (I) or their pharmaceutically acceptable derivatives for the treatment of man is from 0.01 to 30 mg/kg body weight per day and

more particularly 0.1 to 10 mg/kg body weight per day, calculated as the free base, which may be administered as a single or divided dose, for example one to four times per day. The dose range for adult human beings is generally from 8 to 2000 mg/day, such as from 20 to 1000 mg/day, preferably 35 to 200 mg/day, calculated as the free base.

5

The precise amount of the compounds of formula (I) administered to a host, particularly a human patient, will be the responsibility of the attendant physician. However, the dose employed will depend on a number of factors including the age and sex of the patient, the precise condition being treated and its severity, and the route of administration.

10

No unacceptable toxicological effects are expected with compounds of the invention when administered in accordance with the invention.

15

All publications, including but not limited to patents and patent applications, cited in this specification are herein incorporated by reference as if each individual publication were specifically and individually indicated to be incorporated by reference herein as though fully set forth.

Compound I: 4-Chloro-2-iodophenol

(Tetrahedron, 1995, **51**, 8555)

2-Amino-4-chlorophenol (ex Aldrich) (50g 0.35mol) was dissolved in 2.5 M hydrochloric acid (500ml), cooled to 0 °C and a solution of sodium nitrite (25.3g, 0.37mol) in water (50 ml) was slowly added over 20 minutes at 0-5 °C, stirred for 30 minutes, then a solution of potassium iodide (70g, 0.42 mol.) in water (100ml) was added slowly at 0 °C. The reaction mixture was then allowed to warm to 10 °C over 3 hours. The product was then extracted with ethyl acetate (200ml), washed with 10% sodium bisulphite, water, and was dried over magnesium sulphate and evaporated down to dryness. The product was purified by column chromatography with 5% ethylacetate in hexane to give an orange solid. wt.62g. 70% yield.

Compound II: 2-Benzyloxy-5-chloro-iodobenzene

4-Chloro-2-iodophenol (57g. 0.22M) was dissolved in acetonitrile (500mls), caesium carbonate (72.6g, 0.22M.) was added slowly giving rise to an exotherm (19-24° C) over 30 minutes. The reaction mixture was then kept at 24°C for a further 5 hours. The reaction mixture was then stirred at 40 °C for 4 hours, then stirred at room temperature over night. The reaction mixture was filtered and evaporated down to a pink/brown solid. After trituration with water (200ml) the suspension was filtered and recrystallised from hexane (200ml) giving the title compound 50.2g, 65% yield. A second crop gave a further 22.7g. Total yield after drying 88%.  
Rt=13.20 min.

Compound III: (2-Benzyloxy-5-chlorophenyl)-boronic acid

(WO 01/19814 A2)

2-Benzyloxy-5-chlorophenyl iodide (5g 0.0145 mol) in diethyl ether/tetrahydrofuran (100:30) was cooled to -100°C. n-Butyl lithium, 1.6M solution in hexanes (10mL, 0.016 mol) was added dropwise over 15min under nitrogen. The reaction mixture was then allowed to rise to -70°C for 1h. Triethylborate (9mL, 0.03 mol) was added dropwise under nitrogen. The cooling bath was then removed and the reaction mixture was stirred at room temperature overnight. The reaction mixture was then quenched with 2N hydrochloric acid (40mL) and stirred vigorously at room temperature for 1h. The product was then extracted with ethyl acetate, dried over magnesium sulphate and evaporated down to an oil. Purification was carried out on a Biotage (90g cartridge) with ether / iso-hexane (50:50) to give the required product (wt; 2.8g i.e. 74% yield).

Compound IV: (2-Bromo-cyclopenten-1-enyl)-trimethylstannane

n-Butyllithium, 1.6M in hexanes, (58mL, 92.0mmol) in THF (50mL) was cooled under nitrogen to -75°C. 1,2-Dibromocyclopentene (10.00g, 44.3 mmol) in dry THF (10mL) was added dropwise over ~10 minutes. The mixture was stirred at -75°C for a further 20

minutes and then allowed to reach 0°C. The reaction mixture was then re-cooled to -75°C and trimethyltin chloride (8.85g, 44.3 mmol) in THF (30mL) was added, under nitrogen, over ~10 minutes. After stirring at -75°C for 30 minutes the reaction was allowed to reach room temperature and then stirred for 2 hours. The reaction mixture was then evaporated down to an oil and partitioned between brine and dichloromethane (100/200mL). After shaking thoroughly, the organic layer was dried (magnesium sulphate), filtered and evaporated to give an oil. (13.15g, ~80% pure).

**Compound V: 6-Bromopyridine-2-carboxylic acid methyl ester**

6-Bromopyridine-2-carboxylic acid (6.000g) was heated in refluxing methanol (180mL) containing conc. sulphuric acid (2mL) for 4 hrs. The reaction mixture was then cooled to ~0°C and conc. ammonia (4.8mL) was added. The resulting solution was evaporated to give a white residue. This white solid was partitioned between brine and dichloromethane (100/100mL). After thorough shaking the organic layer was dried (magnesium sulphate) and evaporated to give a white solid. (6.300g, 98%).

### General Procedure 1

#### 3-(2-Bromocyclopent-1-enyl)-benzoic acid ethyl ester

1,2-Dibromocyclopentene (Aldrich) (5.000g, 22.1mmol), (3-ethoxycarbonylphenyl) boronic acid (Combiblocks) (4.260g, 22.1mmol), tetrakis(triphenylphosphine)palladium(0) (0.500g) and potassium carbonate (5.000g) were stirred at 80°C under nitrogen for 18h in dimethoxyethane (30mL). The reaction mixture was then filtered through Kieselguhr and evaporated down to give an oil.

Purification by chromatography using iso-hexane containing a gradient of dichloromethane (0-30%) gave the required product (1.150g, 30% yield).

### General Procedure 2

#### 3-(2-Bromo-cyclopent-1-enyl)benzoic acid ethyl ester

(2-Bromo-cyclopent-1-enyl)trimethyl stannane (~80% pure) (13.150g, 43.7mmol), ethyl-3-iodobenzoate (24.000g, 87.4mmol), triphenylarsine (4.000g) and tris(dibenzylideneacetone)palladium (0) (1.500g), were heated in dimethylformamide (20mL) at 100°C, under nitrogen for 92 hours. The reaction mixture was then filtered through highflo, thoroughly washed with dichloromethane, reduced to an oil, and purified by chromatography with iso-hexane containing ether (2%-50%) to give the title compound (4.000g, 28%).

5-{2-[5-Chloro-2-(methoxy)-phenyl]-cyclopent-1-enyl}-nicotinic acid ethyl ester (1.500g, 4.20 mmol) in dry dichloromethane (20mL) was cooled to -75°C. Boron tribromide, 1M solution in DCM, (40mL, 40.0 mmol) was added and the reaction mixture stirred at -75°C for a further hour. The temperature of the reaction was then allowed to rise to -15°C and kept at -15°C for a further 2 hours, and was then quenched in ice/water (50g/50mL). More dichloromethane (60mL) was added and the resulting mixture was stirred vigorously for ~2hrs. The layers were separated and the organic layer was washed with saturated sodium bicarbonate, dried (magnesium sulphate), filtered and reduced to an oil. The oil was then purified by chromatography to give the title compound (0.800g, 60%).

10 **Example 33: 3-{2-[5-methylsulfanyl-2-(benzyloxy)-phenyl]-cyclopent-1-enyl}-benzoic acid**

a) 2-Methoxy-5-methylthiophenylboronic acid

15 1.67M potassium in hexanes (3.5 ml, 5.6 mmol) was added dropwise to a stirred solution of 2-bromo-4-methylthioanisole (1.165g, 5 mmol) in anhydrous tetrahydrofuran (30 ml) at -100°C under nitrogen and stirred for 5 minutes then warmed to -78°C for 1 hour. Triisopropyl borate (2.82 g, 15 mmol) was added dropwise and the mixture allowed to warm to room temperature. Hydrochloric acid (30ml, 30 mmol) were added and the mixture stirred vigorously for 1 hour. The organic phase was separated, washed with brine, dried (MgSO<sub>4</sub>), evaporated to dryness and the residue purified on Biotage using ethyl acetate/ iso-hexane (3:7) to yield the title compound as a white solid. (616 mg, 62%).

20 <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ: 2.47 (3H, s), 3.91 (3H, s), 5.82 (2H, s), 6.87 (1H, d, J=8Hz), 7.41 (1H, dd, J=8Hz, 2Hz), 7.81 (1H, d, J=2Hz).

25 b) 3-{2-[5-methylsulfanyl-2-(methoxy)-phenyl]-cyclopent-1-enyl}-benzoic acid ethyl ester

A mixture of 2-methoxy-5-methylthiophenylboronic acid (594 mg, 3 mmol), 3-(2-bromocyclopent-1-enyl)-benzoic acid ethyl ester ( 885 mg, 3 mmol), potassium carbonate (2.76 g, 20 mmol) and tetrakis(triphenylphosphine)palladium(0) (347 mg, 0.3 mmol) was stirred and heated in 1:1 toluene/ ethanol (30 ml) at 90°C under nitrogen for 4 hours. After cooling the mixture was diluted with diethyl ether/water and the organic phase dried (MgSO<sub>4</sub>), evaporated to dryness and the residue purified on Biotage using ethyl acetate/iso-hexane (1:19) to yield the title compound as a white solid. (790 mg, 71%).

#### General Procedure A

#### A(i) 4-(Benzyloxy)benzotrifluoride

A solution of 4-(benzyloxy)benzotrifluoride (8.55g, 52.78mmol) in acetone (200ml) was treated with benzyl bromide (8.57g, 6.86ml, 58.05mmol) and potassium carbonate (10.94g, 79.16mmol). The mixture was stirred and heated to reflux under nitrogen for 3h. After cooling, diethyl ether (400ml) and water (400ml) were added and the aqueous phase re-extracted with diethyl ether (100ml). The combined organic layers were washed with water, dried (MgSO<sub>4</sub>) and the solvent removed in vacuo to leave the title compound as a white solid. (12.71g, 95%)

<sup>1</sup>H NMR (CDCl<sub>3</sub>) δ: 5.11 (2H, s), 7.03 (2H, d, J = 9Hz), 7.34-7.44 (5H, m), 7.55 (2H, d, J = 9Hz).

#### A(ii) 2-Benzyloxy-5-(trifluoromethyl)iodobenzene

A solution of 4-(benzyloxy)benzotrifluoride (12.71g, 50.4mmol) in acetonitrile (300ml) was stirred under nitrogen and 1-(chloromethyl)-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) (17.75g, 50.4mmol) and iodine (6.4g, 25.2mmol) added. The mixture was stirred at room temperature for 88h. The solvent was evaporated and the residue partitioned between ethyl acetate (400ml) and water (400ml). The organic layer was

washed with water, dried ( $\text{MgSO}_4$ ) and evaporated to an orange oil which was purified by flash chromatography (silica gel, 5% ethyl acetate: isohexane) to give the title compound as an orange oil (15.07g, 79%)

#### A(iii) 2-Benzyloxy-5-(trifluoromethyl)benzeneboronic acid

A solution of 4-benzyloxy-3-iodobenzotrifluoride (15.07g, 39.85mmol) in tetrahydrofuran (200ml) was cooled to  $-40^\circ\text{C}$  with stirring under nitrogen. 2M isopropylmagnesium chloride in diethyl ether (39.85ml, 79.7mmol) was added dropwise and the mixture stirred at  $-40^\circ\text{C}$  for 40 minutes, then cooled to  $-75^\circ\text{C}$ . Trimethyl borate (8.3g, 9.2ml, 79.7mmol) was added at  $-75^\circ\text{C}$  over 10 minutes and the reaction stirred and allowed to reach  $0^\circ\text{C}$  over 1h. 1M hydrochloric acid (200ml) was added and the mixture stirred vigorously for 1h. The layers were separated and the aqueous layer extracted with diethyl ether (100ml). The combined organic layers were washed with water, dried ( $\text{MgSO}_4$ ) and evaporated. The residue was flash chromatographed (silica gel, 5-20% ethyl acetate: isohexane) to give the title compound as a white solid. (7.71g, 65%).

#### General procedure H

5-{2-[5-chloro-2-(benzyloxy)phenyl]cyclopent-1-enyl}-3-morpholin-4-yl- benzoic acid ethyl ester

5-{2-[5-trifluoromethyl-2-benzyloxyphenyl]cyclopent-1-enyl}-3-aminobenzoic acid ethyl ester (198mg, 0.41 mmol), bis(2-bromoethyl)ether (0.15mL, 1.2 mmol), potassium carbonate (568mg, 4.1 mmol) in 2.5 mL of 2-butanone were refluxed for 24hrs. Upon cooling, the reaction mixture was poured into water and extracted with ethyl acetate (3x10 mL). The combined organic layers were dried (MgSO<sub>4</sub>), filtered and concentrated. Purification was carried out on a SPE using iso-hexane containing a gradient of ethyl acetate(5-20%) to give the required product as yellow oil .

#### General Procedure J

5-{2-[5-trifluoromethyl-2-(benzyloxy)phenyl]cyclopent-1-enyl}-3-(4-chloro-butanoylamino)-benzoic acid ethyl ester

4-chlorobutyryl chloride (0.026 mL, 0.22 mmol), was added dropwise to a solution of 5-{2-[5-trifluoromethyl-2-(benzyloxy)phenyl]cyclopent-1-enyl}-3-aminobenzoic acid ethyl ester (100 mg, 0.21mmol) and triethylamine (0.032 mL, 0.22mmol) in DCM (4 mL). The resulting mixture was stirred for 2 hrs at room temperature, then was poured into a saturated solution of (NaHCO<sub>3</sub> 10mL) and extracted with ethyl acetate (20mL). The organic phase was then washed sequentially with 2M HCl, H<sub>2</sub>O and brine. The organic layer was then dried over MgSO<sub>4</sub> and evaporated to give a yellow oil that was used with no further purification.

<sup>1</sup>H NMR (CDCl<sub>3</sub>): 1.24(3H,t,J=7.1), 2.01-2.18(4H,m), 2.50(2H,t,J=6.7), 2.87(4H,m), 3.62(2H,t,J=6.0), 4.23(2H,q,J=7.1), 5.04(2H,s), 6.95(1H,d,J=8.6), 7.05-7.54 (9H, m), 7.84(1H, s).

#### General Procedure K

**5-{2-[5-trifluoromethyl-2-(benzyloxy)phenyl]cyclopent-1-enyl}-3-(2-oxo-pyrrolidin-1-yl)-benzoic acid ethyl ester**

5-{2-[5-trifluoromethyl-2-(benzyloxy)phenyl]cyclopent-1-enyl}-3-(4-chloro-butanoylamino)-benzoic acid ethyl ester (140 mg, 0.24 mmol) and NaH (10.5 mg, 0.26mmol, 60% dispersion in oil) in THF (3mL), were stirred at room temperature for 4 hrs. The reaction mixture was poured into water and extracted with ethyl acetate (10 x 3 mL), the combined organic layers were dried over MgSO<sub>4</sub> and concentrated. Purification was carried out on a Biotage® using 40% of ethyl acetate in iso-hexane to give the required product as an orange oil (60 mg, 46%).

<sup>1</sup>H NMR (CDCl<sub>3</sub>): 1.26(3H,t,J=7.1), 2.01-2.18(4H,m), 2.52(2H,t,J=6.7), 2.88(2H,t,J=7.6), 2.97(2H,t,J=7.4), 3.44(2H,t,J=7.0), 4.26(2H,q,J=7.2), 5.06(2H,s), 6.96(1H,d,J=8.6), 7.18-7.58 (9H, m), 8.09(1H, s).

#### Standard Hydrolysis Procedure

The ester (0.5mmol) was dissolved in methanol or ethanol (2ml) and 2M sodium hydroxide (1ml) added. The mixture was stirred at from room temperature to reflux for from 30minutes to 20 hours until the reaction was complete by tlc. The solution was diluted with water then extracted with isohexane or diethyl ether and acidified to pH4 with either hydrochloric acid or acetic acid. The mixture was extracted with diethyl ether or dichloromethane. The organic solution was dried over magnesium sulphate and evaporated to give the title compound.

4-Fluoro-2-(2-bromocyclopent-1-enyl)anisole (271mg, 1mmol), (3-amino-5-methoxycarbonyl)phenylboronic acid (195mg, 1mmol) and potassium carbonate (1.1g, 8mmol) were stirred under nitrogen in 1:1 toluene: ethanol (4ml) and tetrakis(triphenylphosphine)palladium(0) (116mg, 0.1mmol) added. The resulting mixture was heated at 80°C in a Smithcreator® microwave for 20 minutes. After cooling, diethyl ether (10ml) and water (10ml) were added. The organic layer was washed with water, dried (MgSO<sub>4</sub>) and evaporated. The product was purified by flash chromatography (silica gel, 10-30% ethyl acetate: isohexane) to give the title compound as a pale orange solid (143mg, 42%).

**6-Chloropyridazine-4-carboxylic acid ethyl ester.**

Ethyl 2-nitro-4-furoate (990 mg, 5.35 mmol) was dissolved in ethanol (25 ml) and hydrazine hydrate (0.5 g) was added and the mixture refluxed for 20 minutes then cooled and evaporated to dryness. The residue was dissolved in ether/water and the organic phase dried (magnesium sulphate) evaporated and chromatographed on silica gel eluting with ethyl acetate/iso-hexane (2:3) to give a gum (426 mg) which was dissolved in phosphoryl chloride (4 ml) and heated at 90°C for 30 minutes. The resulting mixture was evaporated to dryness and dissolved in ether /water and the organic phase dried (magnesium sulphate) evaporated and chromatographed twice on silica gel eluting first with ethyl acetate/iso-hexane (3:17) then with methanol/dichloromethane (3:197) to give a solid which was triturated with iso-hexane and filtered off to yield the title compound as an off-white solid. ## 5 ASSAYS FOR DETERMINING BIOLOGICAL ACTIVITY

The compounds of formula (I) can be tested using the following assays to demonstrate their prostanoid antagonist or agonist activity in vitro and in vivo and their selectivity. The prostaglandin receptors investigated are DP, EP<sub>1</sub>, EP<sub>2</sub>, EP<sub>3</sub>, EP<sub>4</sub>, FP, IP and TP.

10

The ability of compounds to antagonise EP<sub>1</sub> & EP<sub>3</sub> receptors may be demonstrated using a functional calcium mobilisation assay. Briefly, the antagonist properties of compounds are assessed by their ability to inhibit the mobilisation of intracellular calcium ([Ca<sup>2+</sup>]<sub>i</sub>) in response to activation of EP<sub>1</sub> or EP<sub>3</sub> receptors by the natural agonist hormone prostaglandin E<sub>2</sub> (PGE<sub>2</sub>). Increasing concentrations of antagonist reduce the amount of calcium that a given concentration of PGE<sub>2</sub> can mobilise. The net effect is to displace the PGE<sub>2</sub> concentration-effect curve to higher concentrations of PGE<sub>2</sub>. The amount of calcium produced is assessed using a calcium-sensitive fluorescent dye such as Fluo-3, AM and a suitable instrument such as a Fluorimetric Imaging Plate Reader (FLIPR). Increasing amounts of [Ca<sup>2+</sup>]<sub>i</sub> produced by receptor activation increase the amount of fluorescence produced by the dye and give rise to an increasing signal. The signal may be detected using the FLIPR instrument and the data generated may be analysed with suitable curve-fitting software.

15

20

25

The human EP<sub>1</sub> or EP<sub>3</sub> calcium mobilisation assay (hereafter referred to as 'the calcium assay') utilises Chinese hamster ovary-K1 (CHO-K1) cells into which a stable vector containing either EP<sub>1</sub> or EP<sub>3</sub> cDNA has previously been transfected. Cells are cultured in suitable flasks containing culture medium such as DMEM:F-12 supplemented with 10% v/v foetal calf serum, 2mM L-glutamine, 0.25mg/ml geneticin and 10<sup>-6</sup>g/ml puromycin.

30

For assay, cells are harvested using a proprietary reagent that dislodges cells such as Versene. Cells are re-suspended in a suitable quantity of fresh culture media for introduction into a 384-well plate. Following incubation for 24 hours at 37°C the culture media is replaced with a medium containing fluo-3 and the detergent pluronic acid, and a further incubation takes place. Concentrations of compounds are then added to the plate in order to construct concentration-effect curves. This may be performed on the FLIPR in order to assess the agonist properties of the compounds. Concentrations of PGE<sub>2</sub> are then added to the plate in order to assess the antagonist properties of the compounds.

35

40

The data so generated may be analysed by means of a computerised curve-fitting routine. The concentration of compound that elicits a half-maximal inhibition of the calcium mobilisation induced by PGE<sub>2</sub> (pIC<sub>50</sub>) may then be estimated.

By application of this technique, compounds of the examples had an antagonist  $pIC_{50}$  value of between 7.0 and 9.5 at  $EP_1$  receptors and  $pIC_{50}$  value of  $< 6.0$  at  $EP_3$  receptors. Preferred compounds have an antagonist  $pIC_{50}$  value of greater than 8.0 at  $EP_1$  receptors.

5

No toxicological effects are indicated/expected when a compound (of the invention) is administered in the above mentioned dosage range.
